

Project Case Study

Project

Place on Brougham Apartments

Brougham Place
North Adelaide SA 5006

Project Summary

Substrate

In situ Concrete

Surface Preparation

Primer

System

Floor levelling compound.

Project Description

The redevelopment of the former Hotel Adelaide required Boulderstone Hornibrook to coordinate many significant trades to restore the buildings shell into the city's most luxurious and exclusive apartments.

Each floor of the building was subjected to various incorrect levels which needed the assistance of a skilful contractor such as Poly-Tech to coordinate, set out and apply a self levelling, cementitious, non structural overlay to the insitu concrete.

The cost effective answer for this project was a light weight, floor levelling compound. This was deemed as the ideal solution as opposed to the much heavier, concrete topping alternative.

Poly-Tech successfully coordinated this multi staged installation which resulted in the pumping of over 3000 bags of levelling compound to seven floor levels.

Upon the contracts completion, the newly levelled floor provided the client with a suitable substrate at the required levels to enable installation of the various top end floor finishes
